Hosting the tool, authentication, status check & reporting

## **Constraints & Limitations**

Limitations of the current version of the tool

## **Next Steps**

What are we trying to achieve in the consecutive versions

# Introduction

## What is a PR

- Pull request(PR) contains code level changes implemented in the local environment of the user, for fixing bugs across many versions of CRM application
- These changes need to be pushed to Server for the fix to be effective in the application

## What are the current challenges

- If the Build of the PR doesn't succeed then the changes do not get pushed. Hence they need to be monitored regularly and steps need to be taken if they fail or expire.
- This process manually takes a long time and decreases the efficiency of the workforce. Hence there arises a need for automated tool to perform this task

# Overview

## How the tool works

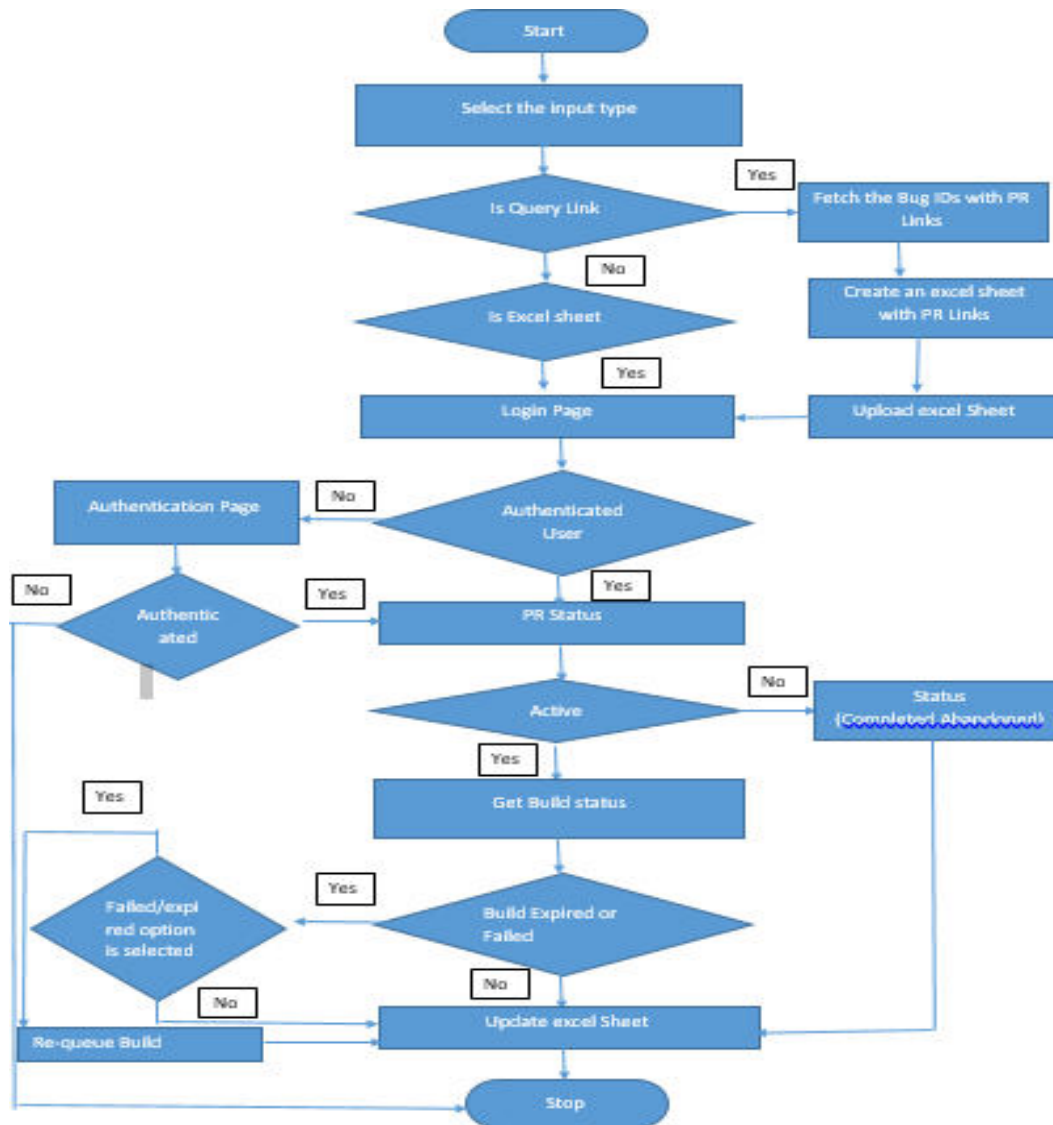

- The PR Status tool is created to automate the process of getting the PR status and build status from the pull requests and update the excel sheets accordingly
- This tool performs two major tasks i.e. getting the build status of the PR given in the input and re-queuing the build if it has expired or failed.
- This tool takes input in two ways. One is in the form of excel sheets with predefined schema, containing PR URLs. And other is TFS Query Link.
- If user enters query link, tool creates a new excel sheet with BugIds and corresponding PR Links of that particular query link. For the PR status, the newly created excel file needs to get uploaded in tool.
- On Completion the tool updates the input file by appending the build status against each PR.
- This tool provides Re-queue Build options(failed/expired) for user to select. The build failed/expired PR gets re-queued based on the options selected. If none of the options is selected, then PR does not get re-queued but only the status will be updated.

# Business Benefits

## Advantages of using the tool along with effort and time savings

- Average time taken for Manual checking of status in TFS
  - ❖ PR Status = 2 minutes
  - ❖ Re-queue the failed build = 3 minutes
- If a bulk port is having 100 PRs then the average effort taken by the FTE =  $100 * 2.5 \text{ minutes} = 4.2 \text{ person hours}$
- PR Status tool will be able to do the same in less than one minute for a PR
- This tool is capable of Re-queueing the bugs
- This tool gives the status of the build against each PR thus by simplifies the status reporting.

# Workflow diagram

Expected PR status:

- Build succeeded
- Build failed
- Build expired
- Build in progress
- Build did not run

Possible Login  
page even  
the user is  
logged in  
previously.

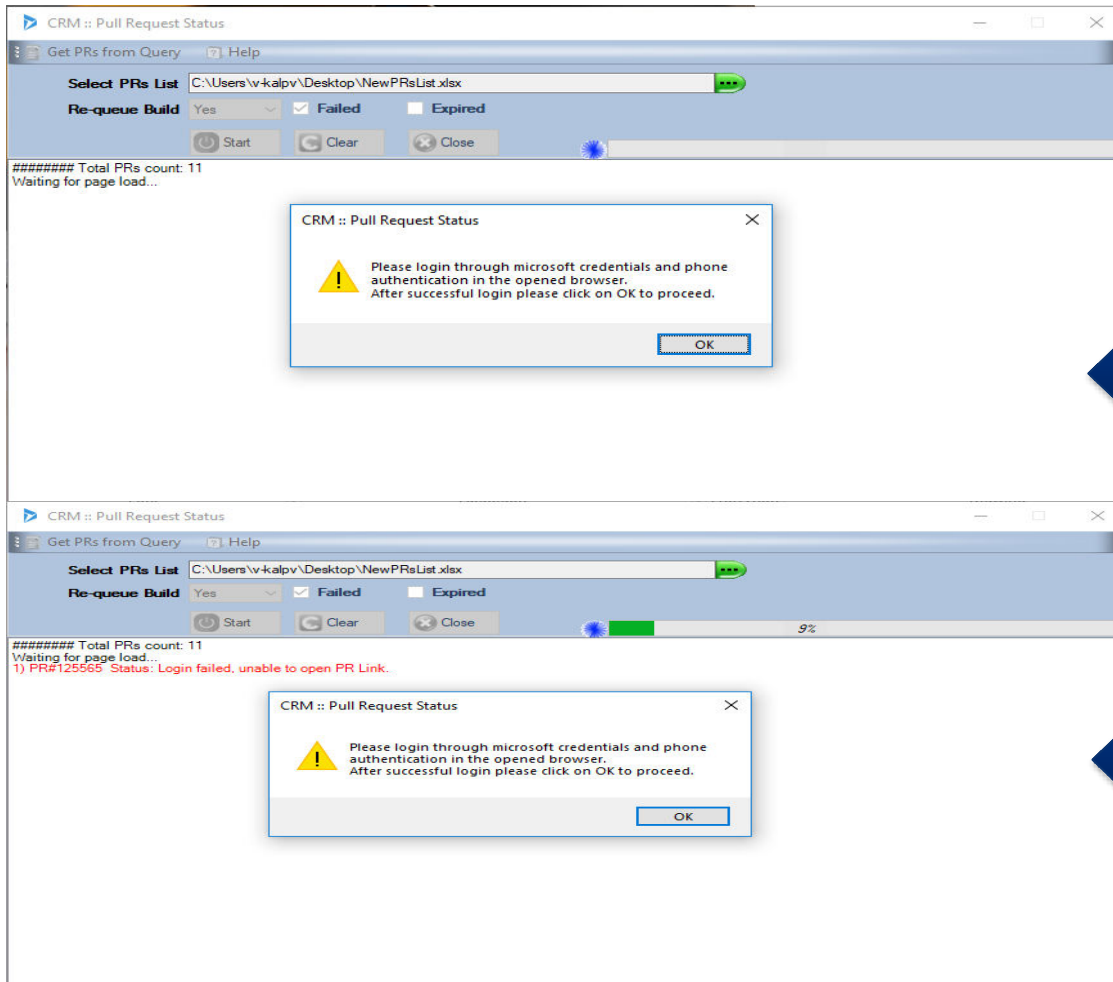

As the login browser opens the user gets notification in the tool User has to press the OK button only after logging into TFS successfully for the process to continue

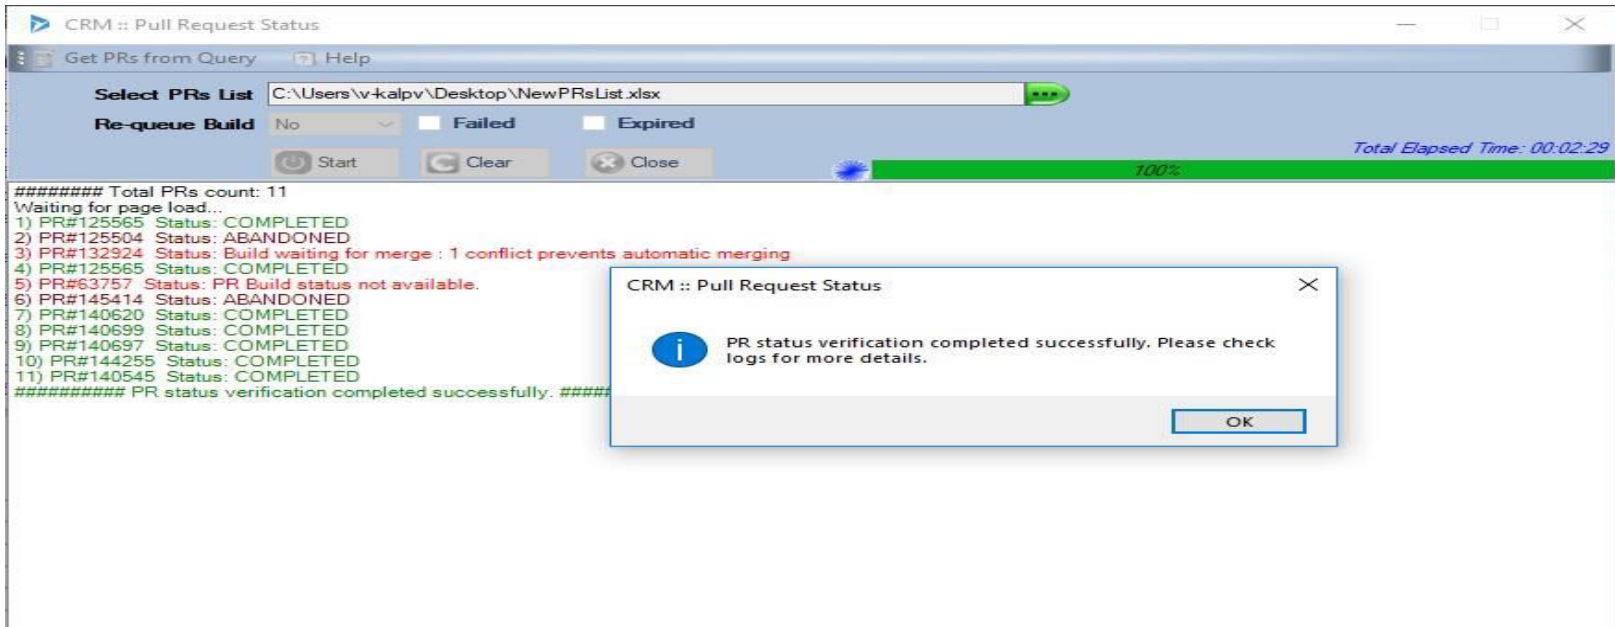

If the user continuing with the tool without logged in

As the login browser opens , the user gets notification in the tool .User has to press the OK button only after logging into TFS successfully for the process to continue.

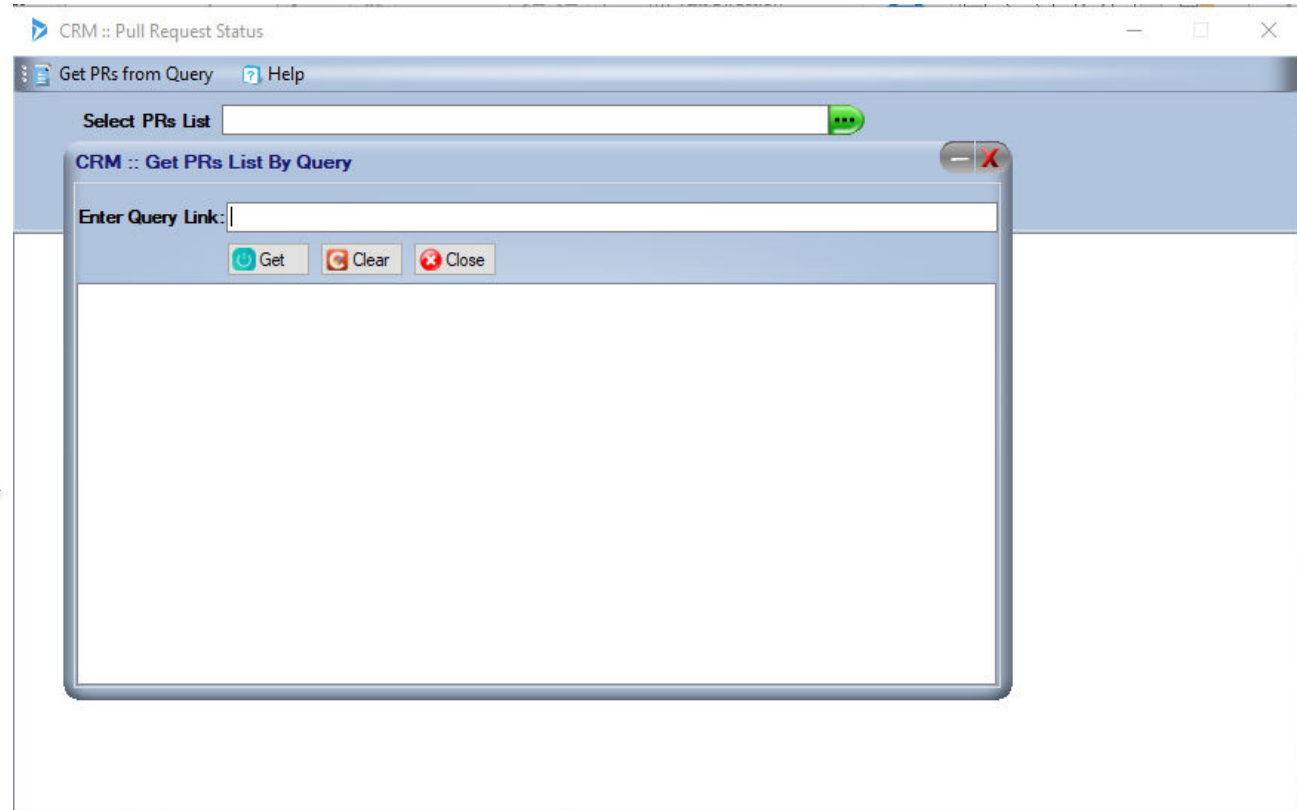

If the user continuing with the tool without logged in

- From the pull request in TFS, the PR status and the build status are retrieved.
- Based on the Re-queue Build options(failed/expired) checked in the tool, build failed or expired PRs get re-queued.
- If both the options are unchecked then the Status is simply reflected in the tool.

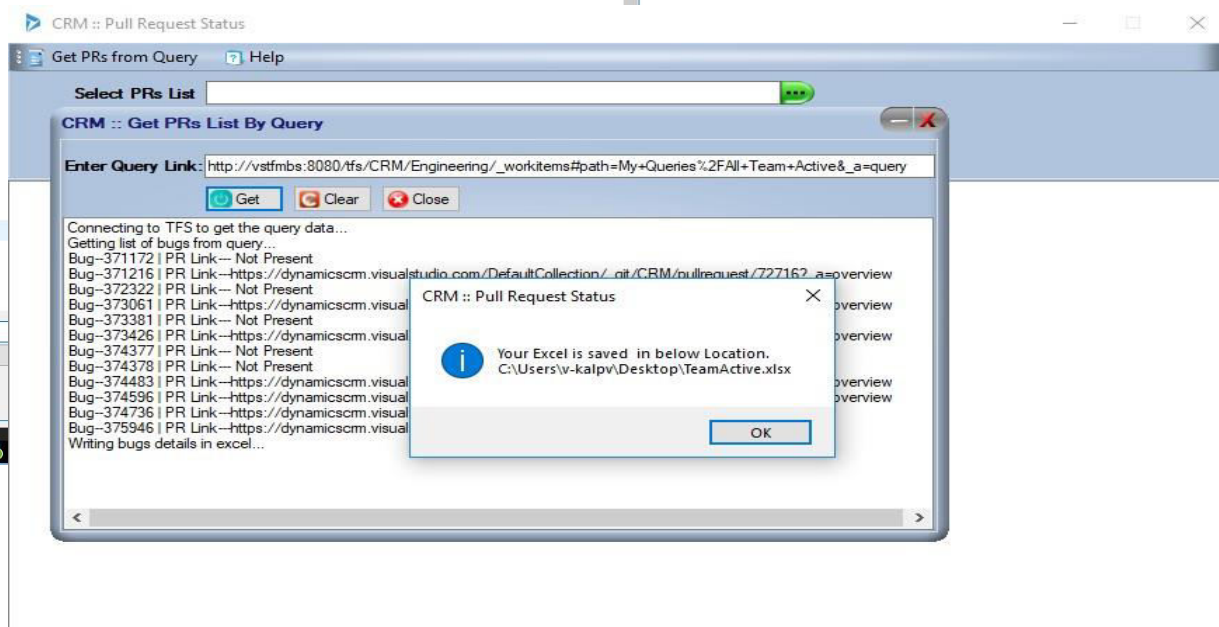

User can extract  
PR URLs from  
TFS Query Link

If User  
Input is  
Query Link

The PR URLs  
extracted from TFS  
link saved as excel  
file.

# Limitations

## **Constraints and Limitations of the current version of the tool**

- The Input has to be in a predefined format.(Excel sheet should contain BugID, PRLink and Status columns)
- Fire fox browser should be installed on end user machine
- Cross browser support functionality in progress.

# Next Steps

- Plans for the consecutive versions
- Currently the tool relies on the client side TFS. So we are working to get the data from the server side for more accuracy.
- We are using some predefined libraries and REST APIs to make the process more efficient and accurate.
- Currently the tool supports Firefox browser only. But with a small change in code it can be compatible to any browser. We are working on the UI level implementation of this.

# Summary

## About the tool in a nutshell

- Helps the FTE in getting the status of the PR and the re-queue the failed builds in an effective manner
- It reduces the effort in checking the status of the PR
- With the help of Selenium, the tool is now compatible with any required browser.
- Currently the tool relies on the client side TFS and we are working to get the data from the server side for more accuracy.
- We are using some predefined libraries and REST APIs to make the process more efficient and accurate.
